

Simulation VIP for HDMI 2.0

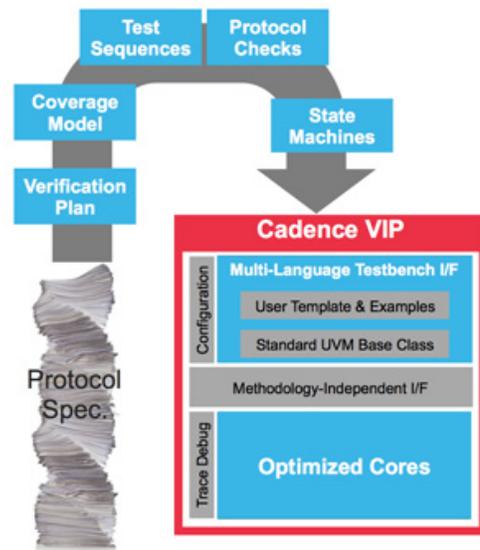

The first VIP to support HDMI 2.0

Overview

Cadence® Simulation VIP is the world’s most widely used VIP for digital simulation. Hundreds of customers have used Cadence VIP to verify thousands of designs, from IP blocks to full systems on chip (SoCs).

The Simulation VIP is ready-made for your environment, providing consistent results whether you are using Cadence Incisive®, Synopsys VCS®, or Mentor Questa® simulators. You have the freedom to build your testbench using any of these verification languages: SystemVerilog, e, Verilog, VHDL, or C/C++. Cadence Simulation VIP supports the Universal Verification Methodology (UVM) as well as legacy methodologies.

The unique flexible architecture of Cadence VIP makes this possible. It includes a multi-language testbench interface with full access to the source code to make it easy to integrate VIP with your testbench. Optimized cores for simulation and simulation-acceleration allow you to choose the verification approach that best meets your objectives.

Specification Support

Our HDMI 2.0 Simulation VIP supports specification versions: 1.3a, 1.4a, 1.4b, and 2.0

Product Highlights

- Industry’s first HDMI 2.0 VIP

Supported Design-Under-Test Configurations

- | | | |
|--|---|-------------------------------------|
| <input checked="" type="checkbox"/> Master | <input checked="" type="checkbox"/> Slave | <input type="checkbox"/> Hub/Switch |
| <input checked="" type="checkbox"/> Full Stack | <input type="checkbox"/> Controller-only | <input type="checkbox"/> PHY-only |

Deliverables

People sometimes think of VIP as just a bus functional model (BFM) that responds to interface traffic. But SoC verification requires much more than just a BFM. Cadence Simulation VIP components deliver:

- State machine models incorporate the subtle features of state machine behavior, such as support for multi-tiered, power-saving modes
- Pre-programmed assertions that are built into the VIP to continuously watch simulation traffic to check for protocol violations.
- Test suites are provided for most Cadence VIP components.
- Pre-programmed coverage models used to capture interesting combinations of simulation results. By analyzing the results collected by the coverage model, engineers can tell if the simulations have exercised the various modes of operation of an interface.
- Verification plans for most protocols link the “raw” coverage model results back to the protocol specification.

“The HDMI 2.0 verification IP provided by Cadence enabled a small verification team to deliver reliable results within very tight schedule constraints. By reducing the effort required to develop a verification solution, our engineers were able to focus on other tasks crucial to project completion. As a result, we were able to create the type of high-quality and reliable design expected by our customers.”

– Larry Porter, Verification Manager, Display Products Division, STMicroelectronics

Key Features

- | | |
|---|--|
| • Supports various 3D video frame formats | • Supports 4Kx2K video frame formats |
| • Supports 3D video formats for 25Hz frames | • Supports configuration of 3D video extension registers in HDMI LLC vendor-specific info-frame packet |
| • Supports configuration of 3D Video extension registers in HDMI LLC Vendor Specific InfoFrame Packet | • Supports configuration of 3D video extension registers in HDMI LLC vendor-specific info-frame packet |
| • Supports all 21:9 video formats defined by CEA-861-F specifications | • Supports different types of audio data and audio channels |
| • Supports six different types of CEC device configurations | • Supports custom frame formats that allows user to configure frame formats that are DUT-specific and not defined in the specification |
| • Supports DDC channel which is used by an HDMI source to determine the capabilities and characteristics of the sink by reading the E-EDID data structure | • Supports different types of extended color spaces exclusively defined within the HDMI specification |
| • Supports all packet types defined in the HDMI Specification 2.0 | • HDMI VIP supports both HDMI and DVI mode of operation. In HDMI mode of operation, the HDMI frame consists of video data, control data, and packets; while in DVI mode, HDMI frame consists of video data and control period only |
| • Supports different types of HDCP encryption mode, supports key selection vectors for transmitter and receiver. Supports transmission and reception of HDCP private keys | • Supports verification of both source (Tx) and sink (Rx) device types |
| • Supports serial and symbol interface types | • Supports the mechanism for detecting and reporting character errors |
| • Supports HDMI CTS 2.0 compliance checks | • Supports RGB, YCbCr 4:4:4 and YCbCr 4:2:2 pixel encodings |

Test Suite

This VIP includes a basic test suite capability that includes:

- Constrained-random example tests
- 3rd party simulator test execution
