**Overview**

Cadence® Simulation VIP is the world’s most widely used VIP for digital simulation. Hundreds of customers have used Cadence VIP to verify thousands of designs, from IP blocks to full systems on chip (SoCs).

The Simulation VIP is ready-made for your environment, providing consistent results whether you are using Cadence Incisive®, Synopsys VCS®, or Mentor Questa® simulators. You have the freedom to build your testbench using any of these verification languages: SystemVerilog, e, Verilog, VHDL, or C/C++. Cadence Simulation VIP supports the Universal Verification Methodology (UVM) as well as legacy methodologies.

The unique flexible architecture of Cadence VIP makes this possible. It includes a multi-language testbench interface with full access to the source code to make it easy to integrate VIP with your testbench. Optimized cores for simulation and simulation-acceleration allow you to choose the verification approach that best meets your objectives.

**Specification Support**

The DSI VIP supports MIPI Display Serial Interface specification version 1.3.1.

**Product Highlights**

- Industry’s first DSI VIP
- Includes D-PHY, DPI, and DBI
- Part of the broadest line of MIPI simulation VIP
- Features optional Accelerated VIP
- Cadence has been a MIPI Alliance Contributing Member since 2007

**Supported Design-Under-Test Configurations**

- [X] Transmitter
- [X] Receiver
- [ ] Hub/Switch
- [X] Full Stack
- [X] Controller-only
- [ ] PHY-only

**Deliverables**

People sometimes think of VIP as just a bus functional model (BFM) that responds to interface traffic. But SoC verification requires much more than just a BFM. Cadence Simulation VIP components deliver:

- State machine models incorporate the subtle features of state machine behavior, such as support for multi-tiered, power-saving modes
- Pre-programmed assertions that are built into the VIP to continuously watch simulation traffic to check for protocol violations.
- Test suites are provided for most Cadence VIP components.
- Pre-programmed coverage models used to capture interesting combinations of simulation results. By analyzing the results collected by the coverage model, engineers can tell if the simulations have exercised the various modes of operation of an interface.
- Verification plans for most protocols link the “raw” coverage model results back to the protocol specification.
### Key Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verifies both DSI processor and peripheral.</td>
<td>Includes the MIPI D-PHY VIP for physical layer verification.</td>
</tr>
<tr>
<td>Supports both PHY interfaces (DpDn and PPI).</td>
<td>Supports one to four data lanes.</td>
</tr>
<tr>
<td>Supports both High-Speed and Low Power data transmission.</td>
<td>Supports Ultra-Low Power mode (ULPM), triggers and LP data transmission.</td>
</tr>
<tr>
<td>Supports several merged packets in a single PHY transmission.</td>
<td>Supports sending and receiving of DSI packets and frames in command mode and all video modes.</td>
</tr>
<tr>
<td>Supports both generation and checks of accurate video mode timings.</td>
<td>Enables the user to control the frame and packet payload.</td>
</tr>
<tr>
<td>Enables the user to read a frame to or from a .ppm file.</td>
<td>Enable the user to control the packets that are sent during BLLP periods in non-VACT lines.</td>
</tr>
<tr>
<td>Provides a set of checkers for monitoring DSC-related traffic.</td>
<td></td>
</tr>
</tbody>
</table>

### Test Suite

This VIP includes a basic and CMS test suite capability that includes:

- Constrained-random compliance tests
- Tests targeting all protocol layers
- 3rd party simulator test execution
- omplete functional coverage model
- Verification plan mapped to protocol specification
- Verification plan integration with Cadence vManager metric-driven analysis systems
