Simulation VIP for MIPI SLIMbus
Used on dozens of MIPI verification projects

Overview

Cadence® Simulation VIP is the world’s most widely used VIP for digital simulation. Hundreds of customers have used Cadence VIP to verify thousands of designs, from IP blocks to full systems on chip (SoCs).

The Simulation VIP is ready-made for your environment, providing consistent results whether you are using Cadence Incisive®, Synopsys VCS®, or Mentor Questa® simulators. You have the freedom to build your testbench using any of these verification languages: SystemVerilog, e, Verilog, VHDL, or C/C++. Cadence Simulation VIP supports the Universal Verification Methodology (UVM) as well as legacy methodologies.

The unique flexible architecture of Cadence VIP makes this possible. It includes a multi-language testbench interface with full access to the source code to make it easy to integrate VIP with your testbench. Optimized cores for simulation and simulation-acceleration allow you to choose the verification approach that best meets your objectives.

Specification Support

The VIP supports the latest version of the SLIMbus specification.

Product Highlights

- Industry’s first SLIMbus VIP
- Part of the broadest line of MIPI simulation VIP
- Cadence has been a MIPI Alliance Contributing Member since 2007

Supported Design-Under-Test Configurations

- [✓] Active Manager
- [✓] Generic Devic
- [ ] Hub/Switch
- [✓] Full Stack
- [ ] Controller-only
- [ ] PHY-only

Deliverables

People sometimes think of VIP as just a bus functional model (BFM) that responds to interface traffic. But SoC verification requires much more than just a BFM. Cadence Simulation VIP components deliver:

- State machine models incorporate the subtle features of state machine behavior, such as support for multi-tiered, power-saving modes
- Pre-programmed assertions that are built into the VIP to continuously watch simulation traffic to check for protocol violations.
- Test suites are provided for most Cadence VIP components.
- Pre-programmed coverage models used to capture interesting combinations of simulation results. By analyzing the results collected by the coverage model, engineers can tell if the simulations have exercised the various modes of operation of an interface.
- Verification plans for most protocols link the “raw” coverage model results back to the protocol specification.
**Key Features**

- Supports up to 8 data lines.
- Supports all protocol messages.
- Supports up to 8 data lines.
- Supports the active framer handover flow.
- Provides ability to change root freq and clock gear.
- Supports all roles of Active Framer (Framing Channel and clocks).
- Supports SLIMbus transport protocols (Isochronous, Pushed, Pulled, Async Simplex, Async half-duplex, Extended Asyncs).
- Supports component boot-up sequence and recovery of sync loss.
- Supports information/value element messages.
- Supports all kinds of protocol resets.
- Supports Clock Pause flows.
- Supports data carrying on multiple channels that have the same direction and sample rate and that are phase-aligned.

**Test Suite**

This VIP includes a basic and CMS test suite capability that includes:

- Constrained-random compliance tests
- Tests targeting all protocol layers
- 3rd party simulator test execution
- e functional coverage model
- Verification plan mapped to protocol specification
- Verification plan integration with Cadence vManager metric-driven analysis systems
